

## **Nomination to JF Prize**

I would like to nominate Professor Tomas Lindahl at Clinical Chemistry, IKE to the JF Prize. In my opinion, he fulfills all the criteria stated for this prize. He has been a great support for younger researchers in his group, looking as much to their interests as to his own. He has willingly shared his experience and thoughts about research and the role as a researcher, and has stepped back when needed to promote the independence of his younger research colleagues. He has given people possibilities to broaden their knowledge and competence by encouraging collaboration with other researchers and by giving them the possibility to get experience in teaching and to participate in conferences. With an open mind for new ways of thinking, his group has often been involved in collaboration projects between the Health and Technical faculties, which have given the group members a broader network and more possibilities to establish their own line of research. His involvement in the research school Forum Scientium has also served to give his PhD students a more independent role with own collaborations and networks, important for a future career. Always willing to discuss and give advice concerning career choices and future opportunities when needed, I think he is a strong candidate for JF Prize.
